

Chapter 16 - Lab

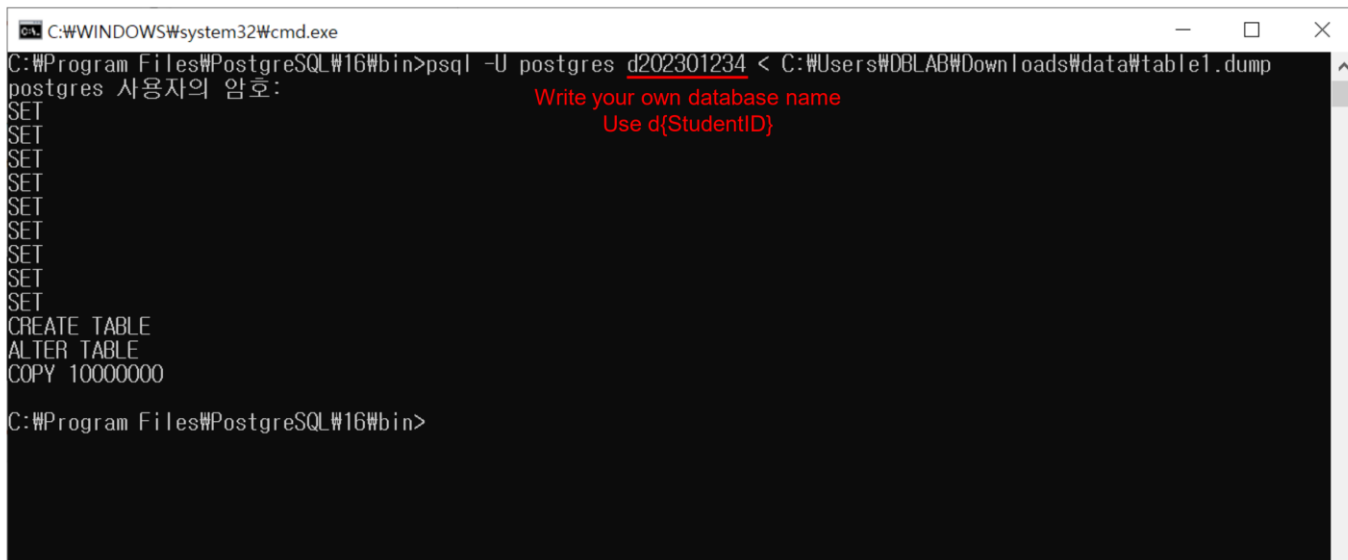

Query Optimization 1

Lab Setup

- Remove table “table1” from PostgreSQL
 - DROP TABLE table1;
- Download the file from blackboard
 - “table1.dump”

Lab Setup (Windows)

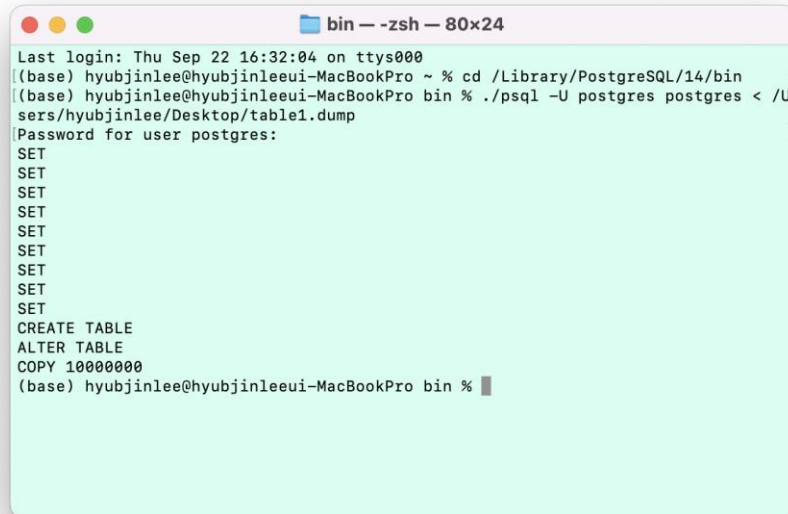

- Open **Command Prompt (cmd.exe)** and type the following commands:
 1. `cd C:\Program Files\PostgreSQL\16\bin`
 - This is the **default** path. If you installed it somewhere else, go to that path.
 2. `psql -U postgres d{StudentID} < [filepath]\table1.dump`
 - For **[filepath]**, type the path where you downloaded “table1.dump”.
 3. Type your own PostgreSQL password

```
C:\WINDOWS\system32\cmd.exe
C:\Program Files\PostgreSQL\16\bin>psql -U postgres d202301234 < C:\Users\OBLAB\Downloads\data\table1.dump
postgres 사용자의 암호:

SET
CREATE TABLE
ALTER TABLE
COPY 10000000
C:\Program Files\PostgreSQL\16\bin>
```

Lab Setup (Max OS X)

- Open **Terminal** and type the following commands:
 1. `cd /Library/PostgreSQL/14/bin`
 - This is the **default** path. If you installed it somewhere else, go to that path.
 2. `psql -U postgres d{StudentID} < [filepath]\table1.dump`
 - For [filepath], type the path where you downloaded “table1.dump”.
 3. Type your own PostgreSQL password

```
bin — zsh — 80x24
Last login: Thu Sep 22 16:32:04 on ttys000
[(base) hyubjinlee@hyubjinleeui-MacBookPro ~ % cd /Library/PostgreSQL/14/bin ]
[(base) hyubjinlee@hyubjinleeui-MacBookPro bin % ./psql -U postgres postgres < /Users/hyubjinlee/Desktop/table1.dump ]
Password for user postgres:

CREATE TABLE
ALTER TABLE
COPY 10000000
(base) hyubjinlee@hyubjinleeui-MacBookPro bin %
```

Lab Setup

- Execute PostgreSQL **SQL Shell (psql)** and login your database
 - Server [localhost]: Press the enter key
 - Database [postgres]: Press the enter key
 - Port [5432]: Press the enter key
 - Username [postgres]: Press the enter key
 - Password for user postgres: **Type your own password**
 - **\c d{StudentID}**

```
postgres=# \c d202301234
접속정보: 데이터베이스="d202301234", 사용자="postgres".
d202301234=#
```

Your answers must be displayed along with your student ID.

- Type on psql command line
 - SET enable_bitmapscan=false;
 - SET max_parallel_workers_per_gather=0;

Table Information

- “table1” has 10,000,000 rows
- “table1”'s schema is as follows:

Attribute	Data Type	Cardinality	Features
sorted	integer	2,000,000	Sorted
unsorted	integer	1,986,519	Unsorted
rndm	integer	100,000	Dummy field
dummy	character(40)	1	Dummy field

Exercise 1

- Consider the following query and make corresponding SQL statements, and then show that the results are the same
 - Select “unsorted” from table1 where the “unsorted” value is 967 or 968 or 969 (967~969)
 - a. Make an SQL statement using “BETWEEN” and “AND” operator
 - b. Make an SQL statement using “IN” operator
 - c. Make an SQL statement using “=” and “OR” operator
 - d. Make an SQL statement using “UNION ALL” operator

Exercise 2

- Execute exercises1's SQL statements under each of the following conditions, and then compare the execution time of the queries
 - a. No index
 - b. B-tree index
 - c. Hash index
- You must drop the B-tree index before doing the Hash index
- 'EXPLAIN ANALYZE' statement shows the execution time of the query

Lab Setup

- Create two synthetic data tables that has 5,000,000 rows with values between 0 and 500
 - CREATE TABLE pool1(val integer);
 - CREATE TABLE pool2(val integer);
 - INSERT INTO pool1(val) SELECT random()*500 FROM (SELECT generate_series(1,5000000)) as T;
 - INSERT INTO pool2(val) SELECT random()*500 FROM (SELECT generate_series(1,5000000)) as T;

Exercise 3

- Following queries have different syntax but return same result
 - a. UNION ALL tables, and then perform aggregation with COUNT function
 - b. Perform aggregation with COUNT function on each table, and then aggregate them again with SUM function on the UNION ALL of the aggregated results
- Write the queries and use 'EXPLAIN ANALYZE' statement to see how the query execution is actually planned

Exercise 4

- Following queries have different syntax but return same result
 - a. SELECT tuple WHERE value is above 250 on each table and then UNION them
 - b. UNION two tables and SELECT tuples WHERE value is above 250
- Write the queries and use 'EXPLAIN ANALYZE' statement to see how the query execution is actually planned

Homework

- Complete today's practice exercises
- Write your queries and take screenshots of execution results
- Submit your report on blackboard
 - 10:29, November 12th, 2024
 - **Only PDF files** are accepted
 - **No late submission**

End of Lab
